The speed in miles per hour of a tsunami can be modeled by the function $s(d) = 3.86\sqrt{d}$, where d is the average depth in feet of the water over which the tsunami travels. Graph this function from depths of 1000 feet to 5000 feet and compare the change in speed with depth from the shallowest interval to the deepest. Use depths of 1000, 2000, 3000, 4000, and 5000 feet for the x -values.

Graph the following and state the domain, range, and end behavior $f(x) = \sqrt[3]{x}$

-8	-2	$(-8, -2)$
-1	-1

Shift Right by 3

Shift Up by 5
